ACADEMIC BACKGROUND

University College London

September 2025 – September 2026

Master of Human-Computer Interaction

- Core Modules: Interaction Science, Interaction Design, Future interfaces, Disability Interaction, Human-AI interaction, HCI for Health & Wellbeing

University of Glasgow

September 2020 - July 2024

Bachelor of Science in Computer Science (**Honours of the Second Class Division I**)

- Core courses: Algorithmic Foundations 2 (A), Web design (Python web), Algorithm and data structure, MySQL database operation and understanding, Human-centred security, web science etc.

The University of Hong Kong

July 2023 - August 2023

Artificial Intelligence (Summer Exchange)

PROJECT EXPERIENCE

Project: "How to Fail your Research Degree" card game digitization project

Team member | Note taker

September 2022 - April 2023

Project link: <https://github.com/apEXzc/HowtoFailYourResearchDegree.git>

- Define learnability and playability as study goals and specify success indicators (initial setup, first-round completion rate, error rate). Identify physical and digital danger spots via contextual interviews.
- Create the information architecture and freshman guidance framework and implement them in Figma and Unity. Communicate client viewpoints in real time, create user stories and acceptance criteria, and incorporate them into Scrum. Perform card-level, prompt, and error recovery design adjustments.

Project: Text Classification Project

Individual Project

January 2023 - March 2023

- Classify text using language processing techniques. Primary responsibility for data preprocessing, feature engineering, and model evaluation. Proficient in dataset segmentation, vectorization, and clustering techniques using Python programming language and machine learning algorithm libraries.
- K-means clustering was used to vectorize the data and evaluate it using a confusion matrix based on the target labels. A variety of classifiers were also used, including one-hot vectorized logistic regression, TF-IDF vectorized logistic regression, etc. Hyperparameters were adjusted, and confusion matrices were implemented to analyse the effectiveness of the classifiers.
- Finally, the Bert model was used to explore whether deep learning-based approaches could improve performance over earlier, more traditional approaches.

Project: Mobile HCI for Smart Glasses Prototype on Glitch: Six-Function Design

Core member | group leader

January 2023 - March 2023

Project link: <https://github.com/Kachuichui/Mobile-HCI.git>

- Conduct contextual interviews with skateboard users (n = 16). Based on task decomposition and risk confirmation, identify the interaction limitations (such as sight obstruction and auditory load) during the sport. Propose metrics like learning curve and false touch rate.
- Use the affinity diagram to summarize five types of problems (HUD information density, visibility of navigation prompts, audio feedback masking, gesture ambiguity, and false touch recovery).
- Build an interactive prototype on A-Frame. Use the Wizard-of-Oz method to simulate voice and gestures. Complete the information architecture of six functions (photography, community, mini-games, navigation, music, and Communication).

Project: Revolutionizing time in the kitchen: Enhancing multitasking efficiency in the kitchen with an augmented reality-based spatial timer

Final Project (A3 and prepare for publishing)

January 2023 - March 2024

Project link: https://github.com/Kachuichui/Final_project.git

- Study 1-Finding user requirements through interviews. Conducted 10-minute semi-structured interviews (n=17), affinity-mapped themes, and pinpointed time management as the principal kitchen challenge, shaping the Spatial Timer prototype and success criteria.
- Study 2 – Usability comparison (SUS): Controlled within-subject test (Spatial Timer vs iPhone); SUS 79.43 vs 66.02, $p < .05$, and 59% of participants completed the “generate timer” task faster with the Spatial Timer, evidencing usability and effectiveness improvements.
- Study 3 – Multitasking workload (NASA-TLX): Summative study (n=14); NASA-TLX 62.68 vs 64.62, $p = .3569$ —not statistically significant overall but trending to lower mental/physical demand with Spatial Timer, informing next-phase sample and task modification.

WORK EXPERIENCE

Post: Software Engineer intern

December 2020 – March 2021

Company: Thorlabs Optical Electronic TECHNOLOGY(Shanghai) Co., Ltd.

Responsibility: Written in the existing software product maintenance and upgrading

CAMPUS ACTIVITIES

Volunteering in Morocco

July 2022 – August 2022

- Created two versions of classes A/B (music and math-oriented).
- Interviewed 37 learners and categorised issues, including speaking rate, terminology grasp, material accessibility, and class involvement.
- Developed a course material usability criteria and class scripts to standardise peer volunteer teacher instruction, resulting in a 4.6/5 post-class satisfaction score.

AWARDS AND HONORS

Scholarship Prize for the University of Glasgow

January 2020

Certificate for Volunteering in Morocco

August 2022

SKILLS AND TALENTS

Computer Skills: Python, C#, JavaScript, SQL (MySQL), A-Frame (WebXR), HTML5/CSS3, Glitch (prototyping/hosting), Python for Web development, Unity, A-Frame (WebXR), Wizard-of-Oz prototyping (voice/gesture simulation), Data preprocessing, Figma, Git/GitHub, Agile/Scrum (user stories & acceptance criteria)

Others: Excellent in Tennis, Basketball, and Running, Scuba diving, hiking, and rugby
